

Microsoft Dynamics Navision 2009

Clarity has a seamless interface to Microsoft Dynamics Navision 2009.

To use this interface, simply select it from Setup->Preferences->Interfaces list.

This seamless interface supports G/L Code Finder. To enable code finder, go to Setup->Preferences->Interfaces and check "Use code finder" checkbox.

At the moment, we only support SQL databases for Navision 2009.

When exporting G/L, you will need to supply the SQL connection parameters (Server Name, Database Name, SQL username, SQL password and Company Name). You will also need to supply the Journal Name and Batch Name, which must exist in Navision database.

Troubleshooting:

1. I get a "C/Front Error" while exporting

Unfortunately Navision SDK does not provide meaningful error messages. If you are getting an error, please make sure that your connection parameters are correct. Make sure the database name is actually the physical database name in SQL server, and the company name is the exact same name of the company as in Navision 2009. Alternatively, you can try connecting to CRONUS database to test settings. The company name for Cronus is "CRONUS Canada, Inc." (without the quotes).

2. I get an error message "Journal (or Batch) name does not exist"

Paymate checks Navision tables to ensure that Journal Name exists in Navision database. Please make sure Journal and Batch names do exist in Navision database.

NB:

The C/Front DLL is no longer supported effective Navision 2013
